

PYTHON DICTIONARY PROGRAMS WITH OUTPUT

1. Create and Print a Dictionary

PROGRAM:

```
student = {  
    "name": "Ashif",  
    "age": 18,  
    "course": "B.Tech IT"  
}
```

```
print(student)
```

OUTPUT:

```
{'name': 'Ashif', 'age': 18, 'course': 'B.Tech IT'}
```

2. Access Dictionary Items

PROGRAM:

```
student = {  
    "name": "Ashif",  
    "age": 18,  
    "course": "B.Tech IT"  
}
```

```
print(student["name"])
```

```
print(student["age"])
```

OUTPUT:

```
Ashif
```

```
18
```

3. Add an Item

PROGRAM:

```
student = {  
    "name": "Ashif",  
    "age": 18  
}
```

```
student["city"] = "Trichy"
```

```
print(student)
```

OUTPUT:

```
{'name': 'Ashif', 'age': 18, 'city': 'Trichy'}
```

4. Change a Value

PROGRAM:

```
student = {  
    "name": "Ashif",  
    "age": 18  
}
```

```
student["age"] = 19
```

```
print(student)
```

OUTPUT:

```
{'name': 'Ashif', 'age': 19}
```

5. Remove an Item

PROGRAM:

```
student = {  
    "name": "Ashif",  
    "age": 18,  
    "city": "Trichy"  
}
```

```
student.pop("city")
```

```
print(student)
```

OUTPUT:

```
{'name': 'Ashif', 'age': 18}
```

6. Get Dictionary Length

PROGRAM:

```
student = {  
    "name": "Ashif",  
    "age": 18,  
    "course": "B.Tech IT"  
}
```

```
print(len(student))
```

OUTPUT:

```
3
```

7. Loop Through Dictionary

PROGRAM:

```
student = {  
    "name": "Ashif",  
    "age": 18,  
    "course": "B.Tech IT"
```

```
}
```

```
for key in student:  
    print(key)
```

OUTPUT:

```
name  
age  
course
```

8. Check if Key Exists

PROGRAM:

```
student = {  
    "name": "Ashif",  
    "age": 18  
}
```

```
if "name" in student:  
    print("Name is available")
```

OUTPUT:

```
Name is available
```
